Back pain

Back pain is an extremely common complaint – an estimated 60 to 80% of people in the UK are affected at some time in their lives and it can strike anyone at any age. Each year, close to five million working days are lost due to back pain.

The spine

The spine is composed of a number of elements and therefore there are a number of potential sources of pain.

The spine is made up of many small bones called vertebrae. These are separated by discs, which allow the spine to bend and take the load through the body. Vertebrae and discs are supported along its length by muscles and ligaments. The spinal cord threads through the centre of each vertebra, carrying nerves from the brain to the rest of the body. The joints at the back of each the vertebrae, one on the left and one on the right, are called the facet joints. These can become inflamed easily and have many pain fibres. Arthritis can develop here.

Sources of back pain

Pain can come from disc problems, facet joints, nerves, bone muscle or ligament. Early identification of the sources of the pain helps to provide a focussed treatment plan for short and long-term benefit.

Back pain may be associated with other symptoms: it may radiate into the legs due to nerve irritation. When severe and in certain distributions this can be due to a slipped disc.

In a relatively small number of cases, back pain may have a more serious underlying cause. This includes abnormality of the spine, an infection or a collapse of the vertebrae, fibromyalgia (a condition that affects the muscles), infection or cancer.

When to see a doctor

Most attacks of simple back pain last only a few days and get better on their own. However if you are having repeated episodes, than a clear identification of the specific problem by a medical assessment is appropriate in order to devise customised treatment.

Anyone with the following symptoms in addition to back pain should see a doctor as soon as possible:

- fever,
- redness or swelling on the back,
- pain down the legs and below the knees,
- numbness or weakness in one or both legs,
- loss of bladder or bowel control.

A doctor should also be consulted if:

- pain lasts longer than a week,
- pain is the result of an injury, a fall or a blow to the back,
- pain lasts for more than a few days in someone aged under 20 or over 55.

Diagnosis

In many cases, the doctor will only need to discuss the symptoms and carry out an examination. The doctor is likely to recommend more tests only if the pain lasts longer than six weeks, or if he or she suspects there is some underlying cause of the pain.

These tests might include X-rays, CT (computerised tomography) scans, MRI (magnetic resonance imaging), blood tests.

Psychological wellbeing can also play a role in back pain. If the condition is chronic, the doctor may also recommend psychological and social assessment.

Treatment

Stay active

Research shows that bed rest does not help simple back pain – it's much better to return to normal physical activity as soon as possible. Staying active may hurt more at first, but it helps the back to heal quickly, and reduces the risk of the problem occurring again.

If the pain is so bad that taking to bed really seems the only option, keep bed rest as short as possible before getting up and about again.

Specific exercises are also important to take the load away from the spine. They are not a quick fix solution, although some exercises can provide quick relief.

Painkillers

Medications of various forms may be appropriate, over the short term and may help to keep you active, which is usually important.

Injections

Local injection therapies can be very helpful for some specific complaints, but these need to be carefully discussed with your doctor.

Manipulation and exercise

Osteopathy and chiropractic are treatments involving manipulation of the spine. They may provide short-term relief for simple back pain within the first six weeks.

The Alexander Technique may help improve posture. Some people find that acupuncture helps with the pain, although there is no definite scientific proof of its effectiveness. And, because back pain can sometimes be related to emotional problems, counselling may also be helpful.

Surgery is necessary only in the tiny minority of cases, for specific situations.

Managing back pain

Good back care can greatly reduce the risk of back pain. To look after your back, make sure you:

- take regular exercise,
- use a chair with a backrest, and sit with your feet flat on the floor or on a foot rest,
- sleep on a firm mattress.

Lifting and carrying tips:

- Lift only a manageable weight, or ask for help.
- When lifting things or putting things down, bend the knees, and keep the back straight and feet apart.
- Do not lift and twist at the same time.
- Lift and carry objects close to the body.

STRETCHING EXERCISES

Stretching exercises help loosen tight muscles.

Technique:	Stretch immediately after a game or workout. Stretch gently and hold for 20 seconds without bouncing (unless otherwise indicated).
Frequency:	Do 6-8 repetitions/stretch (unless otherwise indicated). Stretch at least five days a week.
Precaution:	Discontinue an exercise if it is painful, even with a gentle stretch.

Low Back

	 Side Bend Sit or stand with your back straight. Raise your arm and slowly bend your body over to the opposite side until you feel a stretch.
	 Abdominal Lie on your stomach. Slowly straighten your elbows pushing your upper body off the floor until you feel a stretch along your stomach.
	 Gluteal muscles Lie on your back with your legs straight. Pull one knee toward the opposite shoulder until you feel a stretch along your outer hip.
	· · ·
	 Figure Four (outer hip) Lie on your back with one leg flexed up at the hip and bent 90% at the knee. Pull your knee and ankle together, up and over toward the opposite shoulder. Hold when you feel an outer hip stretch.
4	Cross-Over (outer hip): Lie on your

Cross-Over (outer hip):Lie on your back and cross one knee over your other leg. With the opposite hand, pull you knee up and over toward the opposite shoulder, until you feel an outer hip stretch.

 Keep your foot flat on the ground.

Quadriceps Stretch (front thigh)
 Stand with your back straight and knee bent. Place your foot on a table or chair; keep the thigh pointing straight down. Squeeze your behind together and shift your hips forward slightly until you feel a gentle stretch along the front of your thigh. Don't lean forward or twist your hips.

Kneeling Stretch (front hip)
Kneel on the knee of the leg that you are going to stretch.
Squeeze your behind together and shift your hips forward slightly until you feel a stretch along the front of your thigh.
Don't lean forward or twist your hips.

>	Hamstring Stretch (back thigh). Lie with one leg resting on the floor and the other thigh flexed up toward the ceiling.
5	 Holding your thigh with your hands, slowly straighten your knee until you feel a gentle stretch along the back of your thigh (hamstring). Hold for two counts then relax. Do 10-20 repetitions with leg/day

Upper Back and Neck

 Corner Stretch (pectoral muscles - chest) Stand in a corner with your arms on the walls and one foot in front of the other. Slowly bend your knee until you feel a gentle stretch in your chest muscles, then hold.
 Do not rest your entire body weight on your upper arms - this can stretch the stabilizing structures of the shoulder.
Overhead Stretch (lat muscles - mid back and back of
shoulder). Bend over at the waist and rest your arms on a table with thumbs up.
 Slowly drop your head and body down below your shoulders. Hold when you feel a stretch behind your shoulders and mid back.
 Head Tilt Stretch (side neck) Sit tall while holding onto a chair with your hand. Grab the top of your head with the opposite hand. Slowly pull your head over to the side until you feel a gentle stretch. Repeat on other side.

STRENGTHENING EXERCISES

Exercises to strengthen your muscles will make everyday exercises easier and help prevent injuries.

Technique:	Perform the exercises slowly, avoiding sudden jerking movements.
Frequency:	Do 1-3 sets of 5-20 repetitions, 3-4 days per week (unless otherwise indicated).
Precautions:	Discontinue an exercise if it is painful, especially if it is a beginning level exercise. Do not hold your breath while doing these exercises.

For Low Back Problems

Abdominal Block
 Stand upright with normal posture. Breathing normally, tighten your abdominal muscles and draw your belly button in toward your spine. Hold for three counts then relax. Do 25-50 repetitions per day.

Abdominal Crunch (basic abdominal)

- Lie on your back with your knees bent.
- Do an abdominal block while you slowly raise your upper body and shoulder blades off

the floor.Hold for three counts, and then slowly lower.
Progression: Level 1 - arms at sides Level 2 - arms folded across your chest Level 3 - hands behind your head, elbows back.

|--|

	Superman (upper and lower back)
advanced	 Lie flat on your stomach. Raise one arm, hold for three counts, and then slowly lower. Do the same with your other arm, then each leg. Do 5-20 repetitions for each arm and leg. Progression - Raise the opposite arm and leg at the same time. It must be pain free!

For Neck Problems

Chin Tuck (stretches back of neck and strengthens front of neck)
 While lying down, hold your head straight. Slowly tuck your chin back toward neck spine until you feel a gentle stretch. Hold for 10-20 seconds. Do 5-7 repetitions, 5 to 7 times per week.

For Upper Back Problems

Shoulder Blade Squeeze

- a. Stand or lie on a bench with your elbows bent forward.
- b. Squeeze your shoulder blades together.
- c. Raise your lower arms up to level even with your body and press your shoulder blades down toward your mid back. Hold for three seconds.

EXERCISE PRECAUTIONS

The following exercises are **Not** recommended.

Bent over hamstring stretch
 Caution: This exercise causes the hamstrings to tighten instead of relax (stretch). Bending forward beyond 70% flattens the low back curve and increases disc pressure.
Double leg lift

PREVENTION TIPS

Avoid smoking - Smoking is a risk factor for back pain. It is believed that smoking decreases the circulation to the low back discs which can cause them to crack and rupture.

Maintain a healthy weight - Obesity may contribute to back pain by causing the lower back curve to arch too much.

Minimize your stress - Stress can cause or aggravate back pain. Try these strategies:

- Take a break every 20 minutes when studying or working on the computer.
- Practice time management.
- Try relaxation techniques like the following:

- Lie on your back, eyes closed, knees bent and arms resting at sides.
- 2. Inhale through your nose, and then exhale through your mouth.
- 3. Concentrate on breathing slowly and deeply for a couple of minutes.
- 4. While continuing the breathing pattern, slowly press your low back against the floor, hold 2-3 seconds, and then relax.
- 5. Practice breathing and tensing/relaxing low back muscles until you feel relaxed.

Back Safety for Weightlifting

Arching or flattening the spinal curves too much when weightlifting can cause or increase pain. Try the following tips to protect your back and neck during weightlifting:

	Leg Curl	
	 Use a seated leg curl machine when possible. If doing curl on stomach, don't let hips raise. For both techniques: Maintain normal posture and do abdominal block. Lift with only one leg at a time to protect your back. 	
	Bench Press	
	 Use a seated machine when possible. If using a flat bench, don't raise your hips or arch low back. 	
	 For both techniques: Maintain normal posture. Do an abdominal block. 	
	 Biceps Curl Maintain normal posture. Do an abdominal block. 	

Do an abdominal block.
Lift with only one arm at a time to protect your back.

Cardio Exercise for a Healthy Spine

Aerobic exercise is recommended in addition to stretching and strengthening. In fact, a sedentary lifestyle is often a cause of back/neck pain. Aerobic exercise utilizes large muscle groups (i.e. legs) or multiple muscle groups (i.e. legs, arms and trunk), is rhythmical in nature, and is performed continuously over a period of time. Try to commit to an active lifestyle that extends into all aspects of your day, such as:

- Walking, biking or inline skating instead of driving or taking the bus.
- Taking the stairs.

- Parking your car several blocks away from your destination and walking.
- Taking a walk every 30 minutes, instead of sitting for long periods of time studying or working.

Exercise Formula for Healthy Living & Healthy Spine

Activity:	Exercise doesn't need to be vigorous or continuous, so try to increase the activities that you do on a daily basis. Biking, walking or upright water exercise is less stressful on the back, so they are preferred over swimming, stair climber machines and jogging if you have back problems.
Daily:	Do at least 60 minutes of physical activity. Activities can last for one minute 60 times a day or any other combination totaling 60 minutes.

Ideas for Daily Living

Be mindful of your posture during daily activities like standing, sitting, and sleeping. Your posture habits can cause some muscles to tighten and others to weaken.

Sleeping

A firm mattress promotes proper sleeping posture. Place a 3/4 inch plywood board under a soft mattress to increase its firmness.

Lying on your side, with knees bent, supports the natural curve of the back. Use a flat pillow to support the neck, especially if your shoulders are broad.

Sleeping on the stomach can increase the low back curve and stress the neck and shoulders. If you must sleep on your stomach, place a pillow under your hips to support the low back.

Sleeping on your back is restful and correct when the knees are properly supported.

Packs and Sore Backs - Wearing heavy backpacks or placing them over one shoulder can add to back pain. It can also increase your risk for upper back and shoulder pain. Keep the load light and carry the pack over both shoulders.

Bicycling and Your Back - Adjust bicycle handlebars and seat to support correct posture. Upright handlebars, rather than racing types will place less stress on the lower back.

Footwear - Wear flat-soled shoes with firm arch support. High heel shoes increase the forward curve of the low back. Don't stand in one place too long; shift your weight and change positions. When walking or standing, remember the three curves of the back and practice correct posture.

Neck Tips - Do not lean over your work, hobbies, projects, etc. Angle your work so that you can look straight ahead, or sit closer to your work area. Do neck exercises throughout the day (pages 5 and 7). Try frequent "mini-breaks" to relieve tension. Avoid overhead reaching, use a ladder or stepstool instead. Sex - Avoid stress on your back during sexual intercourse. Try positions which feel comfortable, such as lying on your side or having your partner on top.

Pregnancy - During pregnancy, hormones slightly loosen tissues that hold the vertebrae together. The added weight can also cause strain. Consult your doctor if you experience back problems.

CARING FOR YOUR BACK OR NECK

While dull aches can be annoying and even ignored, severe pain or pain present with other symptoms may indicate a more serious condition.

Call a doctor if your pain involves...

- Fever may indicate an infection
- Frequent, painful or bloody urination may indicate a kidney problem
- Shooting pain down the back of a leg, from the hip down to or below the knee - may indicate a disc problem or pinched nerve
- Numbness or tingling in arm(s) or leg(s) may indicate a nerve or disc problem

- Weakness or paralysis in an arm or leg may indicate a nerve or disc problem
- Persistent pain that can't be relieved may indicate a serious back disorder or injury
- An accident
- Changes in bladder or bowel function may indicate an internal organ problem
- Changes in menstrual cycle
- Changes in skin color (yellow) may indicate an internal organ problem.

Self-Care for Back or Neck

If you haven't experienced any of the above symptoms, you can try self-care to ease pain and promote healing.

First 48-72 Hours	After 72 Hours
 Ice (15-20 minutes, 3-4 times per day Acetaminophen Rest from painful activities Walk or perform other low stress exercise Minimal bed rest 	 Moist heat 15-20 minutes, before exercising Back, abdominal, and hip stretching exercises Back and abdominal strengthening exercises Paracetamol or Ibuprofen

Using Ice and Heat

To relieve initial pain, you can supply an ice pack for 15-20 minutes every two hours for the first 72 hours. Avoid lying on the ice pack, as it could freeze the skin. After the first 72 hours, moist heat, such as a hot shower, bath, wet towels, or hot water bottle, may help relax muscles prior to stretching exercises. Apply 15-20 minutes every few hours.

Massage

Massage helps increase the blood flow to your muscles and helps muscles relax. You may want to consult a massage therapist for assistance.

Medication

Acetaminophen, ibuprofen, and aspirin can help reduce pain. Follow the label for recommended dosages and frequency. Inform your doctor of any drug allergies or adverse reactions.

Rest

Rest from painful activities, but resume daily activities such as walking as quickly as possible. Muscles and other tissues will stiffen and weaken if you avoid exercise for too long.

Exercise

As pain decreases, try the exercises in this brochure. Slight discomfort is normal. Gradually increase the amount, intensity, and frequency of exercise as tolerated.

If you experience severe or prolonged pain, stop and seek medical help. Also stop and seek help if exercises cause numbress or tingling in your arms or legs.

Stress and Tension Management

Muscular relaxation and breathing exercises, meditation, and guided imagery may help relax tense muscles and relieve pain. Listening to soothing music and resting your body and mind may help as well.

Recreational Activities

Some activities, like swimming, walking and water exercise, can help tone and stretch muscles while you recover. However, aggressive twisting, bending and weight bearing activities (like tennis, golf, bowling, racquetball, diving, jogging, and high-impact aerobics) can increase back problems. Therefore, only attempt strenuous activities once your symptoms subside and strength, flexibility and conditioning are restored.

Seeking Help

If your pain worsens or does not decrease after two weeks of self-care, or you have questions or concerns about your back or neck, see a doctor. Evaluation of your problem may include a discussion and review of your medical history, a physical examination and diagnostic tests. These tests may include x-ray, MRI, and/or blood tests.
